docx, ssc sc pdf, ssc mcd. how to solve the preceding problem: This means that the solution you're looking for does not exist. In other words, your question is not a duplicate of this question and not a question at all. This question does not have a satisfactory answer. As such, the question should be closed. Please re-read the How to ask page. CR81, [CR82]. The weak interaction between beta-haemoglobin and haemoglobin S seems to be an important factor in the severity of RBCs in SS. In addition, the sequestration of RBCs may be more severe in this disorder [CR83]. Additionally, the concentration of RBCs in the peripheral blood is very important in maintaining the oxygen-carrying capacity of the blood [CR84]. The primary diagnostic significance of reticulocyte production is in the differentiation between iron deficiency and malaria, in which the reticulocyte count is a much more rapid and sensitive marker than changes in iron status [CR85]. Red cell mass [Sec18] ----- The total amount of red cell mass present in the circulating blood is known as the total red cell volume (TRCV) and has a major importance in the assessment of iron status [CR86]. It may be calculated by dividing the total number of RBCs by their mean corpuscular volume (MCV) or mean corpuscular haemoglobin (MCH) and multiplying by 100, which gives the RBC concentration [CR87]. Other calculation methods include the multiplication of RBC count with the MCV, or the multiplication of the MCV with the haemoglobin concentration [CR88]. The total number of RBCs is the sum of the RBC counts obtained from a complete blood count [CR89]. Hematocrit [Sec19] ----- The hematocrit is the percentage of the total RBC count in the circulating blood. It may be calculated by dividing the total RBC count by the haemoglobin count and multiplying by 100. An increase in hematocrit occurs in anaemia, while a decrease in hematocrit is seen in polycythaemia [CR90]. Ha 82157476af
